

### ## Adding `poetry.exe` to PATH in Windows

The warning message you're seeing indicates that the `poetry.exe` script is installed in a directory that is not included in your system's PATH.

To resolve this issue, you can add the directory where `poetry.exe` is installed to your PATH. Here's how you can do that:

1. **Search for Environment Variables**:

- Right-click on the Start button and select "System".
- Click on "Advanced system settings" on the right-hand side.
- In the System Properties window, go to the "Advanced" tab and click on "Environment Variables".

2. **Modify the PATH Variable**:

- In the Environment Variables window, look for the "Path" variable in the "System variables" section.
- Select it and click "Edit".

3. **Add the New Path**:

- In the Edit Environment Variable window, click "New" and paste the path `C:\Users\louis\AppData\Local\Packages\PythonSoftwareFoundation\PythonSoftwareFoundation\Python\Python310\Scripts`.
- Click "OK" to close each of the windows.

4. **Restart Command Prompt**:

- If you have a command prompt window open, close it and open a new one. This is necessary for the changes to take effect.

5. **Test the Installation**:

- In the new command prompt window, type `poetry --version` to check if Poetry is now recognized.

Remember, editing the PATH variable should be done carefully, as incorrect changes can affect other programs. If you're unsure, it's best to consult the documentation or seek help from a professional.
